MMS 6210 Dual Channel Shaft Displacement Monitor

- · Part of the MMS 6000 System
- Replaceable during operation; stand alone use possible, redundant supply inputs
- Extended selfchecking facilities; built in sensor-self-test facilities; password protected operating levels
- For use with eddy-current type transducer systems PR 6422 /... to PR 6426 /... with CON /...
- Readout of all measured data via RS 232 / RS 485
- · Built-in linearisation facilities
- RS 485 interface for communication with epro's Analysis and Diagnostic System MMS 6850

Applications:

The Dual Channel Shaft Displacement Measuring Module MMS 6210 measures shaft movements such as:

axial shaft positions at shafts ends, rectangular or conical discs also in tandem configurations, differential and thermal expansions as well as radial shaft positions and shaft bendings. It uses outputs from eddy-current type

displacement transducers. These measurements are recommended among and together with others to build up Turbomachine Protection Systems and provide the inputs requested by Analysis and Diagnosis Systems and to provide the inputs requested by Analysis and Diagnostic Systems, Field Bus Systems, Distributed Control Systems, plant/host

computers and networks as e. g. WAN/LAN, Ethernet. Such Systems are also suitable to build up systems to increase the performance and efficiency, the safety of operation and extend the lifetime of machines such as steam-gashydro turbines as well as compressors, fans, centrifuges and other turbomachines.

Technical data:

Sensor inputs:

Two independent inputs for eddy-current type sensor systems.

Sensor inputs are of the differential type, galvanically separated from the power supply.

Input resistance: > 100 kOhm Input voltage range: 0 ... -22 V dc Input frequency range:

0 ... 8 Hz (10 Hz / 3 dB)

Measuring ranges:

Continuously adjustable with the configuration software.

Sensor supply:

For each of the two sensor input channels a separate buffered sensor supply output is available.

These outputs are galvanically separated from all system-voltages as well as from the system supply-voltage.

Open and shortcircuit proof.

Can be operated in parallel with other modules without interference.

Nominal voltage: - 26,7 Volts dc,

Available current:

nom. 20 mA / max. 35 mA

Control inputs:

Common logic binary inputs for both channels:

To select optocoupler mode: "alert"; make or brake mode "danger"; make or brake mode. Channel or module inhibit.

Measuring range multiplication to change the alarm levels during start-up and castdown; adjustable with a factor of 1,0000 ... 4,9999.

24 V logic

Input resistance: > 10 kOhm

Key pulse input:

Key pulse (1 puls per rev.) input for system control 24 V logic Input resistance: >10 kOhm Pulsduration: min. 10 microsec.

Voltage inputs:

(slope triggering)

two, one for each channel Only for FFT applications. 0 ... 10 Volts

Input resistance: >100 kOhm resolution: 10 bit

Measuring modes:

(Each channel to be individually configured)

Different measuring modes can be configured via an externally connected laptop (RS 232 connector on the frontpanel of the module) or via the communication bus. Measuring modes can be changed at any time during operation (function of the module is interrupted for approx. 15 sec.).

Modes for each individual channel:

Axial shaft movements Axial shaft positions

Measures against rectanular and conical discs

Measures differential and thermal expansions

Measures radial shaft positions and shaft bendings

Modes for the two channels in combined use:

Measurements in tandem configuration Minimum/maximum out of two channels

Measurements on conical discs with compensation of e. g. temperature or radial shaft displacements

Measurements on double conical shaft parts

Double channel measurements acc. to API 670

Programmable measuring parameters:

Measuring range

Engineering units Sensorsensitivity

Warning and alarm levels

Channel identification:

By means of KKS numbers or a freely selectable name.

Order analysis functions:

The following parameters derived from an order analysis carried out in the moduls built in microcontroller are available via the RS 485 / RS 232 communication bus:

Limit supervision:

For each channel two separately adjustable alarm levels are available.

The alarm functions can be blocked by the channel clear/circuit fault function or by an external input.

After downloading of a new configuration the alarms are blocked for 15 sec. settling time.

Adjustable range:

5...100 % of fsd. Resolution and reproducibility:

1 ‰ of fsd

Delay time: 1-2-3-4-5-6 sec. selectable Switching characteristic: with increasing signal level Switching hysteresis:

5 % of fsd (only effective during decreasing signal values)

Outputs:

Via potential free opto couplers on the rear strip connector.

 $U_{\text{max}} = 48 \text{ V dc}$ $I_{\text{max}} = 100 \text{ mA}$

Module and sensor supervision:

Channel clear/circuit fault sensing system; the internal modul supervision circuitry continuously supervises the following functions:

Sensor signal is within a preset window. Cabling between sensor and modul is ok (no shortcircuit, no break).

System supply voltages are within preset windows.

Configuration and parameter settings are correct.

Measuring range not overloaded.

Internal temperature not overloaded. System watch dog.

During changing from a sensor malfunction into the ok status or after switching on the modul a delay time of 15 sec. is operable.

"Channel clear" is visualised on the front of the module by means of a green LED; this LED switches off during a "channel fault"; during the delay time the LED flashes.

The channel status is also indicated via a

binary output, separately for each of the two channels.

 $U_{max} = 48 \text{ V dc}$

 $I_{max} = 100 \text{ mA}$

The reasons for a "channel fault" indication can be read out via the communication buses; which enables service personel to take immediate corrective measures.

Signal outputs at the connecting strip:

Terminal strip on rear side: acc. to DIN 41 612, version F 48 M

RS 485 communication interface.

Two independent current outputs:

One for each channel; outputs are proportional to the selected operating mode (e. g. shaft vibration amplitude S1_{op}) 0/4 ... 20 mA; configurable, open- and shortcircuit proof

Permissible load: < 500 Ohms

Accuracy: 16 bit resolution; ±1 % of full range

Settling time: 0 ... 10 sec.; configurable

in increments of 1 sec. separately for each channel.

Two independent voltage outputs:

One for each channel; outputs are proportional to the selected operating mode

0 ... +10 Volt, open and shortcircuitproof Load resistance: > 10 kOhm Resolution: 8 bit

Two independent voltage outputs:

One for each channel; proportional to the DC part of the signal are available; one for each channel. open and shortcircuitproof.

Nominal range: 0...20 V_{pp}

Permissable load: > 10 kOhm

Frequency range: 0,1 Hz ... 16 Khz (±20 % / - 3 dB)

Two independent voltage outputs:

One for each channel; proportional to the DC part of the signal (shaft position) are available. open and shortcircuit proof.

Nominal range: 0 ... 10 Volt dc Permissible load: > 10 kOhm Accuracy: ±1 % of range; Resolution: 12 bit

Operating elements at the module front:

Two independent voltage outputs:

identical to the transducer system inputs are available via SMB sockets; one for each channel.

Range: -1 ... -24 Volts Load: > 100 kOhm

2 green LED's:

Indicate "channel clear" separately for channel 1 and channel 2.

4 red LED's:

Indicate "alert" and "danger" separately for channel 1 and channel 2, for two positive and two negative values.

1 Mini-DIN diode type socket:

As input for the configuration cable RS 232 communication interface.

Handle:

To pull out or insert modul with identification labelling facility

Power supply:

Redundant supply input via two supply inputs, decoupled via diodes. At least one supply input is required for the supply of the module.

Supply voltage:

18....24....31.2 V DC according to IEC 654-2, class DC4

Power consumption:

max. 6 W (max. 250 mA at 24 V)

Other supply voltages can be realized with additional system power supplies.

System design:

At standalone operation, unlimited number of modules.

Max. 31 modules / 62 channels may be operated at one RS 485 bus

If more modules / channels are necessary, e.g. with an MMS 6815, another RS 485 bus must be installed.

Environmental conditions:

Protection class:

Module: IP 00 according to DIN 40050 Front plate: IP21 according to DIN 40050

Climate conditions: according to DIN 40040 class KTF operating temperature range:

0....+65°C Temperature range for storage and

transport: -30....+85°C

Permissible relative humidity:

5....95%, non condensing

Permissible vibration:

according to IEC 68-2, part 6

Vibration amplitude:

0.15 mm in range 10...55 Hz

Vibration acceleration:

16.6 m/s² in range 55...150Hz

Permissible shock:

according to IEC 68-2, part 29 peak value of acceleration: 98 m/s² nominal shock duration: 16 ms

EMC resistance:

according to EN50081-1 / EN50082-2

Machine Monitoring Systems

Dimensions:

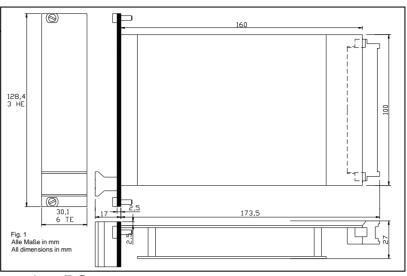

PCB/EURO card format acc. to DIN 41494 (100 x 160 mm)

Width: 30,0 mm (6 TE)
Height: 128,4 mm (3 HE)
Length: 160,0 mm
Net weight: app. 320 g
Gross weight: app. 450 g
incl. standard export packing
Packing volume: app. 2,5 dm3

Space requirements:

14 modules (28 channels) fit into each

19" rack

Requirements on configuration PC:

Configuration of modules is made via the RS 232 interface on the module front or via the RS 485 bus by means of a computer (laptop) with the following minimum specifications:

Processor:

486 DX, 33 MHz

Interfaces:

one free RS 232 interface (COM 1 or COM 2) with FIFO type 156550 UART

Capacity of fixed disk:

min. 5 MB

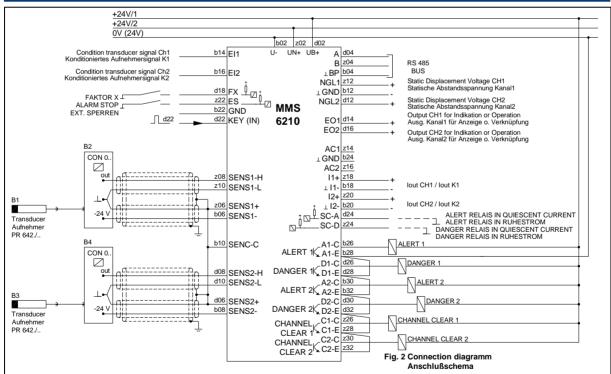

Required working memory:

min. 620 KB

Operating system:

MS DOS Version 6.22 or higher or WIN® 95/98 or NT 4.0

Connection diagram:

Order number:

The F48M mating connector has to be ordered separately depending on the intended wiring technology.
